Compare Ratio Relationships

Compare two rates by scaling both to the same benchmark amount.

Name _____ **Date** _____

Tonight's spark

Two runners train on the rec-center track. Runner A does 9 laps in 6 minutes. Runner B does 12 laps in 9 minutes. Who is faster?

Make a guess first: is the runner with more laps the faster one?

Laps	Minutes	
9	6	
27	18	×3
12	9	
24	18	×2

Our class model: the benchmark

Try it

Work it out on paper. Write one answer on each line.

1. **Store A sells 4 pounds for $10. To compare with a 12-pound offer, scale A to 12 pounds. What is the scale factor?**

   A. 8 **B.** 6 **C.** 3 **D.** 12

   My answer _____

2. **Scale 4 pounds for $10 up to 12 pounds. How much does it cost?**

   A. $18 **B.** $30 **C.** $40

   My answer _____

3 **What is the least number that both 6 and 4 divide into evenly?**

A. 10 **B.** 24 **C.** 12 **D.** 2

My answer _____

4 **Car A goes 150 miles in 3 hours. Scale it to 12 hours. How far does it go?**

A. 600 miles **B.** 159 miles **C.** 450 miles **D.** 50 miles

My answer _____

5 **Machine A fills 5 bottles in 2 minutes. Machine B fills 12 bottles in 4 minutes. Scaled to 4 minutes, which fills faster?**

A. Machine A, because it takes fewer minutes

B. Machine B, 12 bottles is more than 10 in 4 minutes **C.** They fill at the same speed

D. Machine A, because 5 is smaller

My answer _____

Talk about it

Why did you pick 12 lemons as the amount to compare?

Home mission

Pretend one pizza shop sells 2 slices for $3. Another sells 3 slices for $5. Ask your student to pick a benchmark both deals can reach. Which shop is the better deal at that benchmark?

If we get stuck, ask

- What number can both of these reach?
- Did both numbers in the rate get multiplied by the same factor?
- Now that one quantity matches, which one wins?

Do it on a screen

Scan or type the link. Same lesson, with hints.
