# Graph Ratio Tables

Lesson 3-3 • Teacher Copy

**Name:** \_\_\_\_\_  
Type your name

**Date:** \_\_\_\_\_  
Today's date

**Class:** \_\_\_\_\_  
Class period

## TODAY'S OBJECTIVES

**Content Objective:** I can graph the values from a ratio table as points on the coordinate plane.

**Language Objective:** I can explain my graph using the words coordinate plane, ordered pair, origin, and proportional.

See **Learn It** for the explanation and worked examples, and the **Vocab** tab for the words. These are your notes to fill in and keep.

Fill in each blank as we go. Use the Word Bank to help you.

## WORD BANK — FILL EACH BLANK WITH THE BEST WORD

Coordinate plane

Ordered pair

Linear pattern

Proportional

Origin

Tap any word to see what it means and a picture.

Level 3: try the blanks from memory first, then check the bank.

1

The flat grid formed by a horizontal and a vertical number line is the

2

A set of two numbers (x, y) that names a point is an

3

When graphed points form a straight line, they show a

4

Two quantities that always keep the same ratio are

5

The point (0, 0) where the two axes meet is the

## Reflect — Exit Ticket

A ratio table shows cups of rice to cups of water: (1, 2), (2, 4), (3, 6). If you plot these points, the line passes through which point?

- A. (5, 10)
- B. (4, 6)
- C. (5, 8)
- D. (6, 10)

Your answer:

---

---

---

---

---

## Answer Key & Teacher Guide

1. **Notes 1:** Coordinate plane
2. **Notes 2:** Ordered pair
3. **Notes 3:** Linear pattern
4. **Notes 4:** Proportional
5. **Notes 5:** Origin
6. **Watch for this mistake:** *A common mistake in Graph Ratio Tables is skipping the key idea: "The points from equal ratios form a straight line that passes through the origin (0, 0)." — always check your work against this rule before you submit.*
7. **Try It 1:** A. (3, 6) — *Cups (x) come first, scoops (y) second. 3 cups need  $3 \times 2 = 6$  scoops, so the point is (3, 6).*
8. **Try It 2:** A.  $y = 2x$  — *Each cup needs 2 scoops, so y (scoops) is always 2 times x (cups):  $y = 2x$ . For 4 cups,  $y = 2 \times 4 = 8$ .*
9. **Exit Ticket:** A. (5, 10) — *The ratio is 1:2, so for 5 cups of rice you need  $5 \times 2 = 10$  cups of water. The point (5, 10) continues the pattern.*
