UNIT 5 • STANDARD 6.GR.1

Area of Parallelograms

Lesson 5-1 • Teacher Copy

Name: Type your name **Date:** Today's date **Class:** Class period

TODAY'S OBJECTIVES

Content Objective: I can find the area of a parallelogram using $\text{base} \times \text{height}$.

Language Objective: I can explain how I found the area using the words **base**, **height**, **area**, and **formula**.

See **Learn It** for the explanation and worked examples, and the **Vocab** tab for the words. These are your notes to fill in and keep.

Fill in each blank as we go. Use the Word Bank to help you.

WORD BANK — FILL EACH BLANK WITH THE BEST WORD

Parallelogram

Base

Height

Area

Composite figure

Formula

Tap any word to see what it means and a picture.

1 A quadrilateral with two pairs of parallel sides is a .

2 Any side of a parallelogram used to calculate its area is the .

3 The perpendicular distance between the base and the opposite side is the

.

4 The amount of flat space inside a two-dimensional figure is its

.

5 A shape made of two or more basic shapes combined is a .

6 A math rule written with symbols, like $A = b \times h$, is a .

Reflect — Exit Ticket

A parallelogram has a base of 13 inches and a height of 5 inches. What is its area?

- A. 65 sq in
- B. 36 sq in
- C. 18 sq in
- D. 65 in

Your answer:

Answer Key & Teacher Guide

1. **Notes 1:** Parallelogram
2. **Notes 2:** Base
3. **Notes 3:** Height
4. **Notes 4:** Area
5. **Notes 5:** Composite figure
6. **Notes 6:** Formula
7. **Watch for this mistake:** *A common mistake in Area of Parallelograms is skipping the key idea: "Area of a parallelogram = base $\times$ height, where the height is the straight-up (perpendicular) distance, NOT the slanted side." — always check your work against this rule before you submit.*
8. **Try It 1:** A. 40 sq ft — *Area = base $\times$ height = $8 \times 5 = 40$ sq ft. The 7 ft slanted side is not used; only the perpendicular height belongs in the formula.*
9. **Try It 2:** A. Equal: both are $10 \times 6 = 60$ sq ft because area depends on base and height, not the slant — *Area = base $\times$ height. Both have base 10 ft and height 6 ft, so both areas are $10 \times 6 = 60$ sq ft. Tilting the shape changes the slanted side but not the perpendicular height, so the area stays the same.*
10. **Exit Ticket:** A. 65 sq in — *$A = b \times h = 13 \times 5 = 65$ square inches.*
