Lesson 6.4 Teaching Support Guide

Teach-tomorrow route

Print: current Guided Notes and Practice A for the class; Exit Tickets; optional Language Support and supported homework. Keep this guide and answer keys teacher-facing. Use the full-size model pages in the updated notes.

Phase	Planned minutes	Teaching move
Retrieve	5	Warm-Up items 1–4; note the missing prerequisite before launch.
Launch	7	Name the session target and invite a prediction from the conceptual task.
Model	10	Link a visual model to the worked example; rehearse the mathematical explanation.
Practice	18	Core: A #1, #2, #4, #6 and the error task. Choose remaining items from evidence.
Check	5	Exit Ticket; use the diagnostic page before assigning reteaching.

This is a planned 45-minute route, not a measured classroom duration. For a shorter lesson, keep the model and exit; reduce repeated practice. Form B is parallel practice or reassessment only when its items are unseen.

S1: Writing Numerical Expressions · I can write a numerical expression that matches a situation.

S2: Order of Operations with Powers · I can evaluate an expression that contains grouping symbols and powers using the order of operations.

Spaced retrieval: revisit one item after 2 lessons and after approximately 1 week. Mix it with the next unit’s prerequisite check; do not announce the operation before students choose a method.

Session 1 · Writing Numerical Expressions

I can write a numerical expression that matches a situation. · 6.EE.A.2

Observe and respond

Exit item	Expected evidence	Next prompt/model
1	a. 30 − 9 b. 3 × (4 + 5)	Identify the quantities that repeat together before placing parentheses.
2	6 × 2 + 3 = 12 + 3 = $15	Identify the quantities that repeat together before placing parentheses.
3	A — 4 × 7 − 5	Ask the learner to show why A — 4 × 7 − 5 is correct and reject a specific distractor using a model.

Distinguish the error

Conceptual signal: Groups a one-time amount with a repeated amount..

Response: Identify the quantities that repeat together before placing parentheses.

Also check: Adding every number in the story instead of multiplying equal groups (3 + 16 − 5 for 3 bags of 16 crackers, minus 5 eaten).

Also check: Writing “15 less than 40” as 15 − 40.

If calculation alone is wrong, use Session 1 Prerequisite Practice A for the matching skill, then return to the model. If the interpretation is wrong, label the quantities before reteaching the operation. Independent re-entry requires a correct setup and a connected explanation.

Session 1 · Fresh check and scoring

Reserve this check until after revision; it is distinct from the exit ticket. Do not show this teacher page to learners beforehand.

Three packs contain 8 items each, plus 2 singles. Write and evaluate the matching expression.

Teacher solution: 3 × 8 + 2 = 26.

Score the evidence

Score	Evidence	Next action
3	Valid representation, correct result/units, connected explanation.	Continue; fade a support next time.
2	Correct setup and meaning with a calculation/notation slip, or an incomplete explanation.	Brief targeted feedback, then another unseen check.
1	Some relevant facts but a model or interpretation error.	Use the named model and the corresponding prerequisite page.
0	No interpretable evidence yet.	Oral/diagram response to separate access needs from mathematics.

Complete response anchor: 4 × 6 + 3 = 27 matches. 4 × (6 + 3) = 36 would describe 3 additional markers in every box, not three singles.

Misconception response anchor: Groups a one-time amount with a repeated amount.. Use identify the quantities that repeat together before placing parentheses.

Language access: point/draw and label → oral rehearsal → relationship sentence → independent explanation. Offer the support needed for this task and fade it based on evidence. Suggested frame: My model or expression represents ___ because ___. The structure shows ___, so the result is ___.

Session 2 · Order of Operations with Powers

I can evaluate an expression that contains grouping symbols and powers using the order of operations. · 6.EE.A.2c

Observe and respond

Exit item	Expected evidence	Next prompt/model
1	a. 14 b. 30	Bracket the complete base and mark equal-precedence operations in left-to-right order.
2	$2^2 = 4$; $4 \times 3 = 12$; $20 - 12 = 8$	Bracket the complete base and mark equal-precedence operations in left-to-right order.
3	A — 32	Ask the learner to show why A — 32 is correct and reject a specific distractor using a model.

Distinguish the error

Conceptual signal: Applies the power to the wrong base or performs all multiplication before division..

Response: Bracket the complete base and mark equal-precedence operations in left-to-right order.

Also check: Working strictly left to right and adding before multiplying ($8 + 4 \times 3^2$ as 12×9).

Also check: Applying an exponent to a product (2×5^2 as 10^2).

If calculation alone is wrong, use Session 2 Prerequisite Practice A for the matching skill, then return to the model. If the interpretation is wrong, label the quantities before reteaching the operation. Independent re-entry requires a correct setup and a connected explanation.

Session 2 · Fresh check and scoring

Reserve this check until after revision; it is distinct from the exit ticket. Do not show this teacher page to learners beforehand.

Evaluate $18 \div 3 \times 2$ and $(2 + 4)^2$. Explain each first step.

Teacher solution: 12 and 36; division first from the left, and grouping first before the power.

Score the evidence

Score	Evidence	Next action
3	Valid representation, correct result/units, connected explanation.	Continue; fade a support next time.
2	Correct setup and meaning with a calculation/notation slip, or an incomplete explanation.	Brief targeted feedback, then another unseen check.
1	Some relevant facts but a model or interpretation error.	Use the named model and the corresponding prerequisite page.
0	No interpretable evidence yet.	Oral/diagram response to separate access needs from mathematics.

Complete response anchor: $2 \times 9 = 18$; $6^2 = 36$. The grouped expression is the base in the second. $24 \div 4 \times 2 = 6 \times 2 = 12$, evaluated left to right.

Misconception response anchor: Applies the power to the wrong base or performs all multiplication before division.. Use bracket the complete base and mark equal-precedence operations in left-to-right order.

Language access: point/draw and label → oral rehearsal → relationship sentence → independent explanation. Offer the support needed for this task and fade it based on evidence. Suggested frame: My model or expression represents ___ because ___. The structure shows ___, so the result is ___.
