9.2 Connect a Table, Graph and Equation Teacher Key

Teacher use

Costs: 0, 4, 8, 12, 16, 20. Plot (0,0), (1,4), (2,8), (3,12), (4,16), (5,20). Equation: y = 4x. Each increase of 1 notebook increases cost by $4; the plotted points rise 4 for a run of 1.

The ordered pair (2.5,10) satisfies the equation, but buying half of a notebook is not allowed in this context. Show discrete points for whole-number purchases; a continuous line would include impossible purchases.

Feedback and retry

If axes are reversed, ask which quantity is chosen and which depends on it. If students count each vertical square as $1, revisit the labels. Fresh check: 6 notebooks cost $24; locate (6,24).
