Math is Mine — Homework

Lesson 1-1 • Standard MPP.3

Name: _____ **Period:** _____ **Date:** _____

Today's Goals

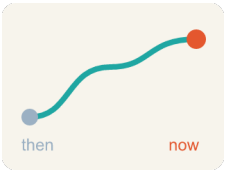

Content: I can describe the ways we are all doers of math, and compare my math story with a classmate's.

Language: I can tell my math story using the words strength, challenge, and I use math when ___ .

Key Words

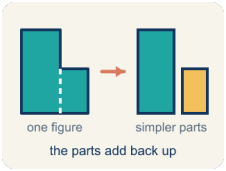

doer of math (persona que hace matemáticas) — Anyone who uses mathematical thinking — which is everyone, every day.

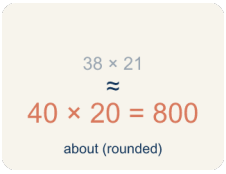

math story (historia matemática) — Your own history with mathematics — what you have done, felt, and learned so far.

strength (fortaleza) — Something you already do well and can share with others.

decompose (descomponer) — To break a number into parts that add, subtract, multiply, or divide back to it.

estimate (estimar) — A reasoned answer that is close enough to be useful, without counting every one.

Practice

Show your work. Use the blank space under each problem.

1. About how many people can ride the Ferris wheel at one time if it has 20 cars that each hold about 4 people?

A. About 5
B. About 24
C. About 80
D. About 400

2. Which of these is a correct way to decompose 78.5?

A. 7 + 8.5
B. 70 + 8.5
C. 70 + 8.05
D. 78 + 5

3. Which decomposition of 78.5 uses multiplication correctly?

A. 39 × 2
B. 39.25 × 2
C. 39.25 × 3
D. 78.5 × 2

4. A Ferris wheel holds about 78 riders per turn and makes 6 turns an hour. About how many riders per hour?

A. About 13
B. About 84
C. About 468
D. About 780

5. Describe three different situations where you use math in your life. Say how the math is the SAME in each one.

6. Which statement matches this lesson's big idea?

A. Only people who are fast at math are doers of math
B. Math only counts when it happens in a classroom
C. Everyone is a doer of math, and we do it in different ways
D. There is one right way to think about a math problem

7. Ask a family member, classmate, or trusted adult about their math story. How is it different from yours? Working alone: compare your math story now with an earlier memory.

8. You estimate 80 riders and the true count is 78. Was your estimate useful?

A. No — an estimate is only useful if it is exact
B. No — you should never estimate
C. Yes — it was close enough to plan with
D. Yes — because any answer is fine

9. What do you want math to be like for you this year?

10. Use mental math to complete each Ferris wheel estimate.

Situation	Estimate	Answer
20 cars, each holding about 4 riders	20 × 4	
About 80 riders each turn, 6 turns in an hour	80 × 6	
About 480 riders each hour, for 2 hours	480 × 2
