Answers and talk notes

Math is In My World

What your student is learning

Tonight we pick a math tool — a tape diagram, a number line, or a table — and use it to turn a big pile of minutes into hours and minutes.

Answers

Ask your student to explain before you look.

1. **A.** 60. There are 60 minutes in 1 hour.
2. **C.** 120. 2 hours is 60 + 60 = 120 minutes.
3. **B.** 45. 4.5 × 10 = 45. Multiplying by 10 moves each digit one place left.
4. **D.** 4. 240 ÷ 60 = 4, so 4 jumps of 60 reach 240 minutes.
5. **A.** 3 hours 20 minutes. 3 hours is 180 minutes, and 200 – 180 = 20 left, so 3 hours 20 minutes.
6. **B.** 5:30 a.m.. 330 ÷ 60 is 5 with 30 left over, so it is 5 hours and 30 minutes after midnight: 5:30 a.m.

Talk about it

How many whole hours fit, and how many minutes are left over?

Home mission

A different situation: use a phone or clock. Start at midnight and ask what time it is 150 minutes later. Let your student count by 60s on their fingers, then say the leftover minutes.

When they are stuck, ask

- Which tool would show this best — a bar, a number line, or a table?
- How many minutes are in one hour? So what do we divide by?
- What does the leftover number mean in this problem?

Try not to say

- Just move the decimal point two places and you have the hours.
- You do not need a picture, just use the calculator.
- The remainder does not matter, round it away.
