Math is Finding Patterns

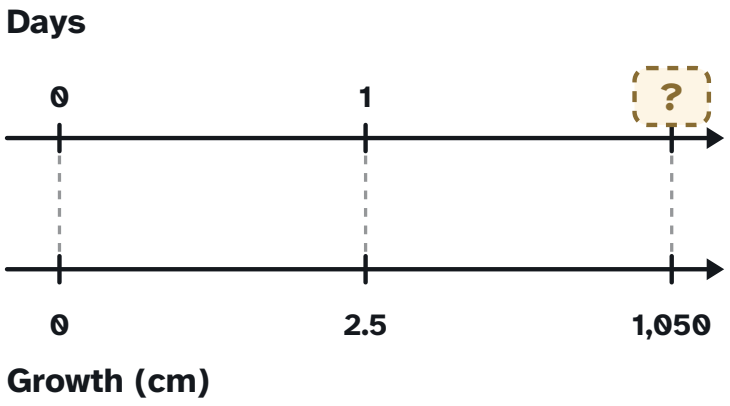
Use a pattern rule to predict how many steps it takes to reach a goal.

Name _____ **Date** _____

Tonight's spark

A growth chart tracks a baby sei whale. It is 4.5 meters long at birth and grows 2.5 centimeters each day. The goal is 15 meters. How many days will it take?

Make a guess first: more or less than 100 days?



Our class model: the growth left ÷ one step

Try it

Work it out on paper. Write one answer on each line.

1. **A puppy gains 2 pounds each month. After 3 months, how many pounds has it gained in all?**

   A. 6 **B.** 5 **C.** 23 **D.** 1

   My answer _____

2. **A plant is 10 cm tall and grows 2 cm each week. How tall is it after 4 weeks?**

   A. 8 cm **B.** 12 cm **C.** 18 cm

   My answer _____

3 **A sapling is 4 m tall and will stop growing at 10 m. How much more will it grow?**

A. 14 m **B.** 40 m **C.** 10 m **D.** 6 m

My answer _____

4 **A pattern adds 5 each step. How many steps does it take to go from 0 to 40?**

A. 35 **B.** 8 **C.** 200 **D.** 45

My answer _____

5 **How many centimeters are in 3 meters?**

A. 300 **B.** 30 **C.** 3,000 **D.** 103

My answer _____

Talk about it

How much is left to grow, and how many steps of the same size does it take?

Home mission

A different situation: hold a ruler. Pretend a seedling is 5 cm tall and grows 2 cm each day. Ask your student how many days until it is 15 cm tall. Say first how much growth is left.

If we get stuck, ask

- How much does it change in one step? And how many steps do we need?
- Are both numbers in the same unit right now?
- Where does it start? Does it start at zero, or somewhere already?

Do it on a screen

Scan or type the link. Same lesson, with hints.
