Answers and talk notes

Math is Finding Patterns

What your student is learning

Tonight we look for a pattern, write the pattern rule in words, and use a table of values to check that our answers are reasonable.

Answers

Ask your student to explain before you look.

1. **B.** $0.05. A nickel is worth $0.05.
2. **D.** $1.00. 10 × $0.10 = $1.00.
3. **A.** Multiply the number by 5. Multiply the number by 5. It works on every row: 1 × 5 = 5, 2 × 5 = 10, 3 × 5 = 15.
4. **C.** 35. 7 × 5 = 35.
5. **B.** $1.00. 4 × $0.25 = $1.00, because 4 quarters make one dollar.

Talk about it

What do you do to the number of coins to get their total value?

Home mission

Gather any coins and pull out the dimes. Count them. Ask your student to use the pattern rule to say what the dimes are worth. Then count by 10 cents to check.

When they are stuck, ask

- What changes from one row to the next?
- Can you say the rule as a sentence?
- Does that answer seem reasonable?

Try not to say

- Just keep adding until you get there.
- The rule doesn't matter, only the answer.
- Memorize the table.
