Answers and talk notes

Math is Everywhere

What your student is learning

Tonight we look for math outside of school — in jobs like being a chef, in hobbies like gardening, and around our own house.

Answers

Ask your student to explain before you look.

1. A chef has a profession. It is a job that takes training.
2. The chef counts the flour, rice, and onions on hand. That is inventory.
3. The chef decides how much rice goes on one plate. That is a portion.
4. A gardener finds the area of a planter to see how many plants fit.
5. A gardener finds the volume of the planter to know how much soil to buy.

Talk about it

What did someone in our home count or measure today?

Home mission

Pick one meal your family eats. Ask your student to be the chef. How many people will eat? How much of each food does one person need? Talk about how you would multiply to plan the whole meal.

When they are stuck, ask

- Where did you see numbers being used today?
- How much is needed for one person?
- What job uses the math we did this year?

Try not to say

- You will never use this in real life.
- Only engineers need math.
- Just write anything down.
