Multiply Decimals

Multiply decimals to find a cost, and check that the answer makes sense.

Name _____ **Date** _____

Tonight's spark

At the market, apples cost $3.40 per kilogram. You buy 2.5 kilograms. The receipt prints a total of $85.00. Does that make sense?

Make a guess first: is the real total more or less than $10?

Our class model: estimate, then count the places

Try it

Work it out on paper. Write one answer on each line.

1 **About how much is 4.1 × $2.95?**

A. About $1.20 **B.** About $12 **C.** About $120 **D.** About $7

My answer _____

2 **How many decimal places does the product of 1.6 × 0.25 have?**

A. 2 **B.** 1 **C.** 3 **D.** 4

My answer _____

3 **What is 2.5 × 4.2?**

A. 10.5 **B.** 105 **C.** 1.05 **D.** 6.7

My answer _____

4 **Grapes cost $4.20 per kilogram. What is the cost of 1.5 kilograms?**

A. $63.00 **B.** $6.30 **C.** $0.63 **D.** $5.70

My answer _____

5 **Ribbon costs $3.25 per meter. Which total is reasonable for 2.4 meters?**

A. $780 **B.** $78.00 **C.** $7.80 **D.** $0.78

My answer _____

Talk about it

How did your estimate help you place the decimal point?

Home mission

Next time you shop, pick something sold by weight. Ask, "About how much for 2.5 kilograms?" Then ask, "Does the number on the scale make sense?"

If we get stuck, ask

- About how much should this be? Estimate before you multiply.
- How many decimal places in the first factor? And in the second?
- Does your answer match your estimate, or is it ten times off?

Do it on a screen

Scan or type the link. Same lesson, with hints.
