Represent and Describe Data in a Box Plot

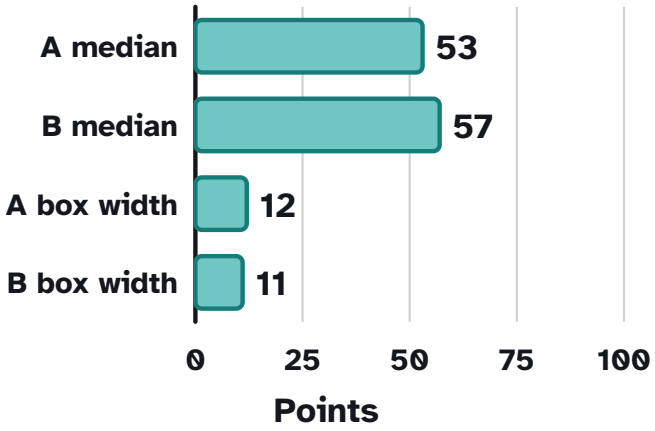
Compare two box plots by their centers and by how spread out they are.

Name _____ **Date** _____

Tonight's spark

Two rec-center teams post their game scores as box plots. Team A: median 53, box 12 wide. Team B: median 57, box 11 wide. Which team scores higher, and which is steadier?

Make a guess first: which team is typically higher, A or B?



Our class model: two looks at two boxes

Try it

Work it out on paper. Write one answer on each line.

1 **Which part of a box plot tells you which group is typically higher?**

A. The median line **B.** The length of the whiskers **C.** The width of the box
D. The title of the graph

My answer _____

2 **Group A has median 40 and Group B has median 52. Which group is typically higher?**

A. Group A **B.** Group B **C.** They are the same **D.** You cannot tell

My answer _____

3 **Class X has a box from 30 to 60. Class Y has a box from 38 to 52. Which class has a more consistent middle half?**

A. Class X, because its box is wider **B.** They are equally consistent

C. Class Y, because its box is narrower **D.** Class Y, because its box is farther to the right

My answer _____

4 **A box plot has Q1 = 25 and Q3 = 41. How wide is the box?**

A. 66 **B.** 8 **C.** 41 **D.** 16

My answer _____

Talk about it

Which week has the higher median, and which has the narrower box?

Home mission

Think of two bus routes you know. Which is typically faster? Which is more on time every day? Can one route win one question and lose the other?

If we get stuck, ask

- Which median line sits higher on the scale?
- Which box is wider? What does the width tell us?
- Can you compare center and spread in the same sentence?

Do it on a screen

Scan or type the link. Same lesson, with hints.
