Determine Equivalent Ratios Using Tables

What your student is learning

Tonight we find a missing amount in a ratio table by multiplying or dividing BOTH numbers by the same amount — the same move as yesterday, now used to find a missing value up or down.

Answers

Ask your student to explain before you look.

1. **C.** 2:3. 6 ÷ 3 = 2 and 9 ÷ 3 = 3, so the new row is 2:3.
2. **B.** 8. 5 × 4 = 20, so the second number is 2 × 4 = 8.
3. **C.** 3. 8 ÷ 4 = 2, so divide 12 by 4 too: 12 ÷ 4 = 3 red.
4. **A.** 12. 3 × 3 = 9, so the missing number is 4 × 3 = 12.
5. **D.** 2. 9 ÷ 3 = 3, so the missing number is 6 ÷ 3 = 2.
6. **A.** 9:21. 3 × 3 = 9 and 7 × 3 = 21, so the row is 9:21.

Talk about it

In each row, what did you do to the first number, and did you do the same thing to the second?

Home mission

Pick any recipe with two amounts, like 1 cup of rice to 2 cups of water. Ask your student to make half a batch, then three batches, saying both new amounts out loud.

When they are stuck, ask

- What number was one part of the ratio multiplied or divided by?
- Now do exactly that to the other part.
- Can you check your answer by scaling back to the original ratio?

Try not to say

- Just add the same amount to both numbers.
- It doesn't matter which direction you scale.
- Only one part of the ratio has to change.
