Analyze Graphs of Relationships Between Two Variables

What your student is learning

Tonight we read a relationship off a graph — its rate of change, its unit rate — and use it to predict a value we cannot see.

Answers

Ask your student to explain before you look.

1. **B.** 4. The rate of change is 4, because y goes up by 4 each time x goes up by 1.
2. **A.** 16. y = 16, because 12 + 4 = 16.
3. **D.** 30. y = 30, because the rate is 3 and 3 × 10 = 30.
4. **C.** the independent value (input). the independent value (input), because the first number in a point is x.
5. **D.** 5. The unit rate is 5, because 10 ÷ 2 = 5.

Talk about it

What is the rate of change on your graph? How did it help you find a point that is not drawn?

Home mission

Pretend a printer makes 13 pages each minute. Ask your student to say the point for 5 minutes, with minutes first. Then ask how they found it.

When they are stuck, ask

- What does this point mean in real words?
- How much does y climb each time x goes up by one?
- Which number in the pair did you write first?

Try not to say

- The order of the coordinates does not matter.
- You can only read values that are drawn on the graph.
- A steeper line always means bigger numbers.
