

LESSON 6-5 • SESSION 1 • GUIDED NOTES

Writing Algebraic Expressions

Learning target – I can write an algebraic expression that uses a variable for an unknown amount. · 6.EE.A.2a

WORDS TO KNOW*fill in the missing words*

WORD	WHAT IT MEANS	EXAMPLE
variable <i>variable</i>	A _____ that stands for an unknown number.	the m in $14m + 35$
coefficient <i>coeficiente</i>	The number _____ by the variable.	In $14m$, the coefficient is 14
constant <i>constante</i>	A number by itself that does not _____.	the 35 in $14m + 35$
algebraic expression <i>expresión algebraica</i>	An expression with at least one _____.	$14m + 35$

KEY IDEA*complete each sentence*

- An amount that repeats “each” time goes with the _____.
- A one-time amount is the _____.
- Order matters: “4 less than x ” is x ____ 4.

WORKED EXAMPLE*fill in the blanks as we solve*A bike shop charges \$9 per hour plus a \$3 helmet fee. Write an expression for the cost of h hours.**Step 1** The \$9 repeats each hour: $9 \times h =$ ____.**Step 2** The one-time fee is the constant: ____.**Step 3** Join the terms with a plus sign.**Answer** The cost is ____ dollars.**YOU TRY***use the example as a model***1.** Write an algebraic expression.**a.** 6 more than n ____**b.** the product of 4 and k ____**2.** Concert tickets cost \$10 each plus one \$4 fee. Write an expression for the cost of t tickets.*Show your work.***Expression** _____**SUM IT UP***in your own words*In $9h + 3$, the 9 goes with h because ____.

LESSON 6-5 • SESSION 2 • GUIDED NOTES**Evaluating Algebraic Expressions**

Learning target – I can evaluate an algebraic expression by substituting a value for the variable. · 6.EE.A.2c

WORDS TO KNOW*fill in the missing words*

WORD	WHAT IT MEANS	EXAMPLE
substitute <i>sustituir</i>	_____ a variable with a given number.	If $b = 7$: $6b = 6 \times 7$
evaluate <i>evaluar</i>	Find the _____ after you substitute.	$6 \times 7 - 9 = 33$
variable <i>variable</i>	A letter that stands for a _____.	the b in $6b - 9$

KEY IDEA*complete each sentence*

- To evaluate, _____ the value for the variable.
- Then use the _____ of operations: powers, then $\times$ and $\div$, then $+$ and $-$.
- $4x$ means $4 \times x$. When $x = 3$, $4x = \underline{\hspace{1cm}}$, not 43.

WORKED EXAMPLE*fill in the blanks as we solve*Evaluate $7p - 2$ when $p = 4$.**Step 1** Substitute: $7 \times \underline{\hspace{1cm}} - 2$.**Step 2** Multiply first: $7 \times 4 = \underline{\hspace{1cm}}$.**Step 3** Subtract: $28 - 2 = \underline{\hspace{1cm}}$.**Answer** $7p - 2 = \underline{\hspace{1cm}}$ when $p = 4$ **YOU TRY***use the example as a model*

1. Evaluate when
- $a = 3$
- .

a. $5a + 1 = \underline{\hspace{2cm}}$

b. $a^2 - 4 = \underline{\hspace{2cm}}$

2. A garage charges
- $3h + 6$
- dollars for
- h
- hours. Find the cost for 5 hours.

*Show your work.***Answer** _____ dollars**SUM IT UP***in your own words*When I evaluate $4 + 2p$, I multiply first because ____.
